

Meet the VTLD1 Vacuum Tube Loop Driver

The ultimate buffering interface for your guitar, pedals, and amplifier

What: Two fully discreet vacuum tube stages (Drive & Recover) specifically designed to interface your guitar pickups to and from your stomp pedals, and on to your amplifier.

Why: Guitar tone and touch response integrity:
Your guitar wants to see a vacuum tube before it sees anything - especially a chain of stomp boxes and the inherent array of capacitive loading patch cords and connections in the chain.

How: Two dual triode stages (12AY7 / 12AT7), discreet relay signal switching, custom tailored impedance matching, loss compensation circuitry with Drive Level, High Frequency Trim and Recover Level controls.

Plus: Sublime vacuum tube Gain Boost with Level and Tone controls. With a discreet Mute/Tune function so you no longer need to plug through a tuner.

Dimensions: 6" w x 5.8" d x 3.5" h Weight: 2.4 lbs

12 VAC supply included or:
CIOKS AC10 or C10KOLATE are recommended
